Problem Statement

This example is adapted from a real production application, but with details disguised to protect confidentiality.

You are a famous researcher in the City of Peacetopia. The people of Peacetopia have a common characteristic: they are afraid of birds. To save them, you have to build an algorithm that will detect any bird flying over Peacetopia and alert the population.

The City Council gives you a dataset of 10,000,000 images of the sky above Peacetopia, taken from the city's security cameras. They are labelled:

- y = 0: There is no bird on the image
- y = 1: There is a bird on the image

Your goal is to build an algorithm able to classify new images taken by security cameras from Peacetopia.

There are a lot of decisions to make:

- · What is the evaluation metric?
- How do you structure your data into train/dev/test sets?

Metric of success

The City Council tells you that they want an algorithm that

- 1. Has high accuracy
- 2. Runs quickly and takes only a short time to classify a new image.
- 3. Can fit in a small amount of memory, so that it can run in a small processor that the city will

Before implementing your algorithm, you need to split your data into train/dev/test sets. Which of

these do you think is the best choice? Train Dev Test 6.000,000 3.000.000 1,000,000 0 Train Dev Test 9,500,000 250,000 250,000 Train Dev Test 6,000,000 1.000,000 3.000,000 Train Dev Test 3.333.334 3.333.333 3,333,333 Yes. 5. After setting up your train/dev/test sets, the City Council comes across another 1,000,000 images, called the "citizens' data". Apparently the citizens of Peacetopia are so scared of birds that they volunteered to take pictures of the sky and label them, thus contributing these additional 1,000,000 images. These images are different from the distribution of images the City Council had originally given you, but you think it could help your algorithm. Notice that adding this additional data to the training set will make the distribution of the training set different from the distributions of the dev and test sets. Is the following statement true or false? "You should not add the citizens' data to the training set, because if the training distribution is different from the dev and test sets, then this will not allow the model to perform well on the test set.") True False False is correct: Sometimes we'll need to train the model on the data that is available, and its distribution may not be the same as the data that will occur in production. Also, adding training data that differs from the deviset may still help the model improve performance on the deviset. What matters is that the dev and test set have the same distribution. One member of the City Council knows a little about machine learning, and thinks you should add the 1,000,000 citizens' data images to the test set. You object because: The 1,000,000 citizens' data images do not have a consistent x-->y mapping as the rest of the data (similar to the New York City/Detroit housing prices example from lecture). The test set no longer reflects the distribution of data (security cameras) you most care about.

/ Correct

A bigger test set will slow down the speed of iterating b evaluating models on the test set.	ecause of the computational expense of
This would cause the dev and test set distributions to b you're not aiming where you want to hit.	ecome different. This is a bad idea because

7.0%

What does this mean? (Check the two best options.)

Dev set error

Test set error

9. Which of the following statements do you agree with?

	What does this mean? (Check the two best options.)	
	You should try to get a bigger dev set.	
	✓ Correct	
	You have underfit to the dev set.	
	You have overfit to the dev set.	
	✓ Correct	
	You should get a bigger test set.	
12.	After working on this project for a year, you finally achieve:	
	Human-level performance	0.10%
	Training set error	0.05%
	Dev set error	0.05%
	If the test set is big enough for the 0.05% error estimate to be a ≤ 0.05	ccurate, this implies Bayes error is
	✓ Correct	
	It is now harder to measure avoidable bias, thus progress will b	e slower going forward.
	✓ Correct	
	With only 0.09% further progress to make, you should quickly b 0%	e able to close the remaining gap to
13.	It turns out Peacetopia has hired one of your competitors to but and your competitor both deliver systems with about the same However, your system has higher accuracy! However, when Peacompetitor's systems, they conclude they actually like your conteven though you have higher overall accuracy, you have more falarm when a bird is in the air). What should you do?	running time and memory size. cetopia tries out your and your spetitor's system better, because
	 Look at all the models you've developed during the developmen lowest false negative error rate. 	t process and find the one with the
	Ask your team to take into account both accuracy and false neg	ative rate during development.

Rethink the appropriate metric for this task, and ask your team to tune to the new metric.

14. You've handily beaten your competitor, and your system is now deployed in Peacetopia and is protecting the citizens from birds! But over the last few months, a new species of bird has been slowly migrating into the area, so the performance of your system slowly degrades because your data is being tested on a new type of data.

You have only 1,000 images of the new species of bird. The city expects a better system from you within the next 3 months. Which of these should you do first?

- Use the data you have to define a new evaluation metric (using a new dev/test set) taking into account the new species, and use that to drive further progress for your team.
- Put the 1,000 images into the training set so as to try to do better on these birds.
- Try data augmentation/data synthesis to get more images of the new type of bird.
- Add the 1,000 images into your dataset and reshuffle into a new train/dev/test split.

15. The City Council thinks that having more Cats in the city would help scare off birds. They are so happy with your work on the Bird detector that they also hire you to build a Cat detector. (Wow Cat detectors are just incredibly useful aren't they.) Because of years of working on Cat detectors, you have such a huge dataset of 100,000,000 cat images that training on this data takes about two weeks. Which of the statements do you agree with? (Check all that agree.)

If 100,000,000 examples is enough to build a good enough Cat detector, you might be better of training with just 10,000,000 examples to gain a ≈10x improvement in how quickly you can run experiments, even if each model performs a bit worse because it's trained on less data.

Buying faster computers could speed up your teams' iteration speed and thus your team's productivity.

✓ Correct

Having built a good Bird detector, you should be able to take the same model and hyperparameters and just apply it to the Cat dataset, so there is no need to iterate.
